Cowichan Valley Regional District 175 Ingram Street Duncan, BC V9L 1N8

Attention: Ilse Sarady

Dear Ms. Sarady,

RE: Groundwater Investigation near Fisher Rd., Cobble Hill, BC

1.0 INTRODUCTION

1.1 Background

The Cowichan Valley Regional District (CVRD) retained Waterline Resources Inc. (Waterline) on behalf of the Cobble Hill Aquifer Interagency Task Group (CHAITG), to investigate groundwater conditions near 1345, 1355 and 1360 Fisher Road in Cobble Hill, British Columbia (the Site; Figure 1).

The CHAITG is a working group comprised of representatives from the CVRD, Island Health, the Ministry of Environment and Climate Change Strategy (ENV), Ministry of Forests, Lands, Natural Resources Operations and Rural Development (FLNRORD) and the Ministry of Agriculture. CHAITG was formed to work collaboratively on the groundwater and drinking water concerns associated with the known nitrate contamination at the Site.

The Fisher Road area is a mix of industrial, commercial, residential, and agricultural lands. The Site comprises of the following industrial/commercial businesses shown on Figure 2:

- 1345 Fisher Road Central Landscaping Supplies, currently operating as a composting facility and a landscape supply business,
- 1355 Fisher Road Fisher Road Recycling, currently operating as a recycling and composting facility, and
- 1360 Fisher Road Gamboa Greenhouses operated a vegetable greenhouse which ceased operations in 2017.

An investigation at the Site by ENV in 2002 concluded that land use practices in the area had resulted in elevated nitrate concentrations in groundwater exceeding drinking water guidelines for the *Environmental Management Act - Contaminated Site Regulation* (CSR) and the *Canadian Drinking Water Quality* (GCDWQ) standards. The nitrate contamination in groundwater at the Site

is believed to have originated from organic sourced nitrogen from composting at 1345 and 1355 Fisher Road and inorganic-sourced nitrogen from synthetic fertilizers historically used at 1360 Fisher Road vegetable greenhouse. Nitrate concentrations in groundwater at the Site may also be elevated due to migration of impacted water from upgradient agricultural and rural land use practices southeast of the Site, not associated with 1345, 1355 and 1360 Fisher Road.

A series of groundwater studies and investigations have been commissioned to investigate the contaminant issue at the Site, including:

- A site investigation of 1345 and 1355 Fisher Road. (EBA, 2010),
- An environmental assessment of the groundwater at 1355 Fisher Road. (Thurber, 2011),
- Installation of four groundwater monitoring wells by the CVRD (MW12-1, MW12-2, MW12-3, and MW13-4) upgradient and downgradient of the Site, screened across the water table to help delineate and characterize the nitrate contamination initially observed in the Production Well at 1355 Fisher Road. (Thurber, 2013; Figure 3),
- Fisher Road. groundwater investigation Well sampling program (Thurber, 2014), and
- Fisher Road. groundwater investigation Data review (WWAL, 2018).

FLNRORD and the CVRD also published a report on the *Groundwater Quality of Aquifers in the South Cowichan Valley, Vancouver Island* (Barroso et.al, 2019). The report provides data on background levels of nitrates in groundwater near the Site.

In addition to the above groundwater monitoring programs, steps have been taken to address groundwater quality impacts from 1345, 1355 and 1360 Fisher Road. In late 2018, a Pollution Prevention Order was issued by ENV which required the composting facility at 1345 Fisher Road to install a pond liner in their leachate collection pond. The facility was also required to repair the asphalt surface and the berms around asphalt surface where the compost is made. A groundwater protection plan was imposed for the facility on March 12, 2021 through the issuance of a new Waste Stream Management Licence (Licence) under the CVRD's Bylaw No. 2570 - *Waste Stream Management Licensing Bylaw, 2004* (Bylaw 2570). Under the new Licence, the facility is required to sample the compost leachate collection pond water and install a groundwater monitoring well on their property. Alternatively, they may seek to enter into an agreement with the CVRD to monitor the groundwater at MW12-3 which is located immediately downgradient of the facility.

Under the provisions of the Environmental Management Act, and in accordance with their Operating Permit (#108536) issued by ENV on February 9, 2018 and their Licence under CVRD Bylaw 2570, the compost facility at 1355 Fisher Road is required to sample the leachate collection ponds, the onsite Production Well, the CVRD MW12-1 and facility's new monitoring well (MW19-5). MW19-5 is located on the northwestern side of their property boundary and downgradient of their facility (Figure 3).

At 1360 Fisher Road, the new owners are working on a rezoning application for the property and have been requested by the CVRD to conduct a stage two Preliminary Site Investigation (PSI 2)

for a better understanding of the fertilizer contamination from this site. Requirements for a PSI 2 investigation are detailed in Section 58 and 59 of the CSR and can include sampling of the relevant environmental media (soil or groundwater), laboratory or field analysis of environmental media and assessment of substance concentrations relative to standards in the CSR.

1.2 Objectives and Scope of Work

The objective of Waterline's study is to document current groundwater conditions at the Site, and to assess if the nitrate contamination is being appropriately managed by current landowners. The following scope of work was completed by Waterline:

- Sampled the CVRD monitoring wells (MW12-1 to 3, and MW13-4),
- Compiled the groundwater chemistry and groundwater level data (both recent and historic) for the CVRD monitoring wells, the production and monitoring well at 1355 Fisher Road,
- Compiled geochemistry data and prepared summary tables, groundwater level hydrographs and time-series concentration plots,
- Interpreted and evaluated trends in the groundwater chemistry spatially and temporally, groundwater flow and contaminant transport, and potential environmental impact, and
- Completed a report summarizing the findings.

2.0 METHODS

2.1 Groundwater Sampling Program

The 2020 and 2021 field activities were carried out in accordance with the British Columbia Field Sampling Manual (ENV, 2013) and the British Columbia Environmental Laboratory Manual (ENV, 2015). At each of the CVRD monitoring wells, Waterline completed an inspection of well condition, measured the water level, downloaded the transducer with datalogger, measured and recorded insitu field chemistry parameters, and collected a groundwater sample. Monitoring well construction details are provided in Table A1 (Appendix A). Details of the sampling events are as follows:

- In 2020, groundwater samples were collected using Waterra tubing on February 27. Three
 well volumes were purged from each well prior to sample collection. It was noted that this
 sampling method agitated the water column, resulting in highly turbid samples. In addition,
 the fine-grained sediment plugged off the Waterra tubing, requiring continuous cleaning of
 the foot valve and additional field time and effort by field staff.
- In 2021, groundwater levels and water quality samples via HydraSleeve deployment was completed on February 24. Samples were collected on March 3. HydraSleeves were utilized to reduced agitation of the water column, thus decreasing the sample turbidity, and improving the overall sample quality. This low-flow sampling technique also eliminated the need to purge a large volume of water to obtain a representative sample from the aquifer.

Waterline understands that Goode Environmental Services Ltd. (Goode) of Victoria was commissioned to complete the groundwater sampling work for the composting facility at 1355

Fisher Road in accordance with the requirements of Operating Permit #108536. Groundwater monitoring requirements under the Operating Permit includes sampling of the onsite Production Well, MW19-5 and CVRD's MW12-1. Since 2019, this facility has also voluntarily sampled CVRD MW12-2, MW12-3, and MW13-4. The sampling has occurred quarterly, in accordance with an agreement with the CVRD. Monitoring data collected by Goode since 2019 was uploaded to the provincial Environmental Monitoring System (EMS) database and has been considered as part of this report.

2.1.1 Analytical Program

Groundwater quality samples were collected to assess the groundwater geochemistry at the Site. The water samples collected by Waterline were submitted to CARO Analytical Services (CARO) in Richmond, BC. CARO is in good standing with Canadian Association for Laboratory Accreditation (CALA) and hold a valid permit to practice (Permit # 3010). Isotope samples taken for the CVRD monitoring wells were analyzed by Isotope Tracers Technology Inc. in Waterloo, ON, a partner lab of CARO. A summary of the analytical parameters is included in Table A2; the following water analysis were completed:

- Stable isotopes of nitrogen (N14, N15) and oxygen (O16, O18),
- General chemistry, including total and dissolved carbon,
- Major anions and cations,
- Dissolved metals, and
- Nutrient parameters including nitrogen species Total Kjeldahl Nitrogen (TKN indicating organic forms of nitrogen), nitrate, nitrite, and ammonia (indicating inorganic forms of nitrogen).

2.2 Data Compilation

Waterline used our in-house geodatabase data management system (Enviro Web Services [EWS]) to compile historical groundwater chemistry data for the CVRD wells and the wells at 1355 Fisher Road, including the sampling results collected by Waterline and Goode in 2020 and 2021. The EWS water quality tool allows for rapid assessment of geochemical trends for water quality parameters including contaminants of concern such as nitrogen species. In addition, EWS allowed Waterline hydrogeologists to perform quality assurance/quality control (QAQC) of the reported water quality parameters, through comparison of historical values and water quality standards.

3.0 RESULTS

3.1 Site Inspection

A visual inspection of the CVRD monitoring wells was completed by Waterline. Site inspection photographs are included in Appendix B. Generally, the condition of the four CVRD monitoring wells was good (Photographs B1 to B4; Appendix B) and met the standards of Groundwater Protection Regulation (GWPR; Government of BC, 2016). The vegetation around the casing did

not appear to be stressed, indicating that no surficial disturbance or changes had occurred since Waterline's initial site visit in March 2020.

During the September 2020 sampling event completed by Goode, it was noted that the well casing at MW12-3 was "loose". The CVRD confirmed this and secured the well casing temporarily. Waterline further confirmed the condition of the well during the February 2021 field visit. It is assumed that the well casing may have been struck by machinery operating at or near 1345 Fisher Road.

To ensure that representative groundwater samples could be collected from MW12-3 by the composting facilities at 1345 and 1355 Fisher Road and that the well cover meets the maintenance standards listed in Section 41 of the GWPR (Government of BC, 2016), the CVRD contracted Drillwell Enterprises Ltd. to complete the well repairs. The damaged section of well casing (Photograph B5; Appendix B) was replaced and the casing protector was re-secured with a new surface seal (Appendix B6; Appendix B).

3.2 Physiography and Regional Hydrogeology

To understand the surface water and groundwater hydraulics beneath the Site, the regional hydrogeological/hydrological setting, and the physical location of the Site within the watershed(s) is needed. The Site straddles the watershed divide that separates the Patrolas Creek watershed to the north and the Shawnigan Creek watershed to the south (Figure 4). Surface water drainage at the Site is expected to follow topography and predominantly flows southwest towards Shawnigan Creek, which migrates approximately five kilometers to the southeast and discharge to the ocean at Mill Bay (Figure 4). There is also a small component of surface water that drains northward into the Patrolas Creek watershed (Figure 4).

The Site is underlain by Aquifer 206 south of the watershed divide and Aquifer 197 mapped to the north of the divide (ENV, 2020; Figure 5). Although Aquifers 206 and 197 are mapped as two distinct aquifers, monitoring wells and supply wells appear to be screened across one water bearing unit and are likely hydraulically connected. Table 1 provides a description of the two overburden aquifers mapped in the area.

Table 1: Description of Aquifer Conditions at the Site

| Aquifer Number | Aquifer Name | Aquifer Type | Aquifer Material | Aquifer Vulnerability | Comments |
|-------------------|-----------------|-----------------|---------------------------|--------------------------|----------------------|
| 197 | Cherry Point | Confined | Glacial - Sand and Gravel | Moderate | 942 associated wells |
| 206 | Mill Bay | Unconfined | Glacial - Sand and Gravel | High | 235 associated wells |

Aquifer 197 is described as confined from the surface due to a low permeability till unit (Dashwood till) covering the aquifer. Aquifer 206 has a variable cover and is best described as a semi-confined aquifer near the Site, classified as highly vulnerable to contamination by surface activities. At present, groundwater quality in both aquifers is considered excellent with an average background nitrate concentration of 0.5 mg/L (Barroso et.al, 2019).

3.3 Groundwater Flow Assessment

The following groundwater flow observations and characteristics are summarized for the Site:

- Water level elevations measured from the CVRD monitoring wells in 2020 and 2021 (Table A3) confirmed that the groundwater flow direction beneath the site is in a northwest direction, as reported by WWAL in 2018 (Figure 6).
- An average horizontal hydraulic gradient across the Site, was calculated to be 0.0043 m/m (unitless) for the month February 2021.
- Using a bulk average hydraulic conductivity of 1x10 ⁻⁵ m/s (WWAL, 2018) and a porosity of 30% for the sand and gravel aquifer, the average linear groundwater velocity is estimated to be approximately 4.5 m/year. Therefore, the residence time for groundwater in the aquifer to move across the Site is approximately 97-years without the influence of any pumping activities.
- However, pumping of the 1355 Fisher Road Production Well likely causes a cumulative drawdown effect in the aquifer and captures groundwater at some radial distance from the site, enhancing the movement of groundwater. WWAL (2018) completed a capture zone analysis assuming various continuous pumping rates of up to a maximum of 100 cubic meters per day (m³/day). As can be seen in the WWAL report, the 1355 Fisher Road Production Well is capturing groundwater from the adjacent properties, specifically from 1360 Fisher Road (WWAL, 2018).
- Pressure transducers with data loggers (transducers) were temporarily installed in select groundwater monitoring wells to record changes in water levels at the Site. The transducers are portable devices that can be interchanged between wells and are not permanent.
- There is a data gap in recorded groundwater levels from December 2019 to present as transducers were removed from the wells for calibration (Figure 7). The transducers were reinstalled in MW12-1 and MW12-3 during Waterline's site visit on March 3, 2021 (Figure 7). The data logger from the MW13-4 was not re-installed as the unit has reached its end of life.
- Figure 7 shows a water level hydrograph for MW12-1, MW12-3, and MW13-4. The data shows a decline of water levels from 2012 to 2015. This downward trend is followed by an increasing trend from 2015 to 2019. Precipitation data from climate station ID 1017230 indicates a period of drought (or lesser cumulative precipitation) prior to 2015, followed by increased annual cumulative precipitation between 2015 and 2019. This pattern has been observed in other coastal areas of Vancouver Island (Waterline, 2020).
- Seasonal fluctuation in groundwater levels is observed "over-printing" the longer-term groundwater water level record, with the highest water level elevations in the summer months and lowest elevations in the winter months (Figure 7).
- There appears to be a time lag for aquifer recharge following the winter rainy period (October to February). The water level rise in the aquifer (i.e., recharge) occurs slowly into the the summer when groundwater supply is needed. This lag time is likely due to the semiconfined nature of the aquifer and a 34-55 m thick unsaturated zone that separates the saturated portion of the aquifer from surface. The unsaturated zone consists of a thin unit of sandy till (lower permeability) above a large sequence of sand (higher permeability).

3.3.1 Groundwater Quality Assessment

Due to the presence of private domestic groundwater users and the Cobble Hill Improvement District (CHID) water supply wells in the vicinity of the Site, groundwater quality data collected/reviewed as part of this assessment was compared to drinking water guidelines for comparison purposes. Guideline concentrations from Schedule 3.2 of the CSR (Government of BC, 2019) and the GCDWQ (Health Canada, 2020) were used.

The drinking water quality standards with recent and historical groundwater sampling results, including field measured parameter results, are provided in Tables A4 to A7 (Appendix A). In cases where the CSR and GCDWQ are both listed, exceedances were reported for the most stringent guideline. Laboratory certificates and their QA/QC reviews for Waterline's 2020 and 2021 sampling programs are provided in Appendix C.

3.3.2 General Groundwater Chemistry

Groundwater at the Site is a calcium - bicarbonate type water, with a total dissolved solids (TDS) concentration ranging from 154 mg/L at MW13-4 (background location) to 666 mg/L MW12-2 (downgradient of the 1360 Fisher Road site; Table A4, Appendix A). A Durov plot of the major-ions concentrations and TDS, is presented on Figure 8. In general, all major ion concentrations are elevated in down gradient wells (MW12-1, 2, and 3) in comparison to MW13-4. However, all major ion concentrations are below the CSR and/or GCDWQ guideline limits (Table A5, Appendix A).

Groundwater in unconfined and semi-confined aquifers are typically in directly contact with atmospheric oxygen. The maximum solubility of oxygen in natural groundwater systems is approximately 10 mg/L under ambient temperature and pressure conditions. Dissolved oxygen (DO) concentrations measured in monitoring wells at the Site ranged from 3.8 to 7.5 mg/L in 2021 (Table A4, Appendix A) and as such are slightly undersaturated with respect to DO. This may be characteristic of the deeper groundwater system. Reported values decreased in comparison to 2020 measurements, due to the low-flow sampling technique using HydraSleeves. The oxidation reduction potential (ORP) measured in 2021 ranged from 107 to 185 mV and were lower than was measured in 2020 (Table A4, Appendix A).

The average concentration of total and dissolved organic carbon (TOC and DOC) was 2.1 and 3.1 mg/L, respectively (Table A4, Appendix A). These concentrations are comparable to the 2018 sample results collected by WWAL (Table A4, Appendix A). Of all the dissolved metals parameters tested in 2020 and 2021, only cobalt exceeded CSR guideline (Table A6, Appendix A). Historically, exceedances were noted for manganese and chromium (GCDWQ), lead (GCDWQ & CSR), aluminum, iron, nickel, and vanadium (CSR). However, concentrations of these elements are now all below the applicable regulatory standards.

The general groundwater chemistry results reported for the Site are comparable to groundwater chemistry reported as part of the South Cowichan Valley aquifers study (Barroso et.al, 2019).

3.3.3 Nitrogen and Oxygen Isotopes

Nitrogen and oxygen isotopes (15N and 18O) were sampled from the CVRD monitoring wells in 2020. The 15N vs 18O ratios were plotted with historical isotope data from 2012 to 2018 to characterize the different nitrate sources at the Site (Figure 9). When plotted against the isotopic ranges for different nitrate source zones, as sited by Kendall (1998), the 2020 data confirmed that nitrate in groundwater is from three distinct sources:

- An organic source observed at MW12-1 and MW12-3, consistent with composting operations at 1345 and 1355 Fisher Road (Figure 9).
- An organic source observed at MW13-4, believed to be from current and or historic upgradient agricultural (manure) and rural land use practices (septic fields) in the area, migrating onsite overtime (Figure 9).
- An inorganic source observed at MW12-2 and the 1355 Fisher Road Production Well, consistent with anticipated parameters from historical fertilizer use at the 1360 Fisher Road (Figure 9). As discussed in Section 3.3, pumping from the 1355 Fisher Road Production Well appears to capture the nitrate-impacted groundwater beneath the former greenhouse facility at 1360 Fisher Road and therefore may provide some hydraulic containment.

3.3.4 Nitrogen Concentrations in Groundwater

Past studies commissioned to investigate the contaminant issue at the Site have determined that leaching and transport of nitrate from surface operations into the underlying groundwater system originated from three distinct sources; 1345, 1355 and 1360 Fisher Road. More stringent source control measures have been implemented at 1345 and 1355 Fisher Road to reduce the risk of contaminant load to the subsurface. However, a residual mass of nitrate that may be contained in the soil pore space, will drain over time to field capacity. Although some flushing of the residual nitrates may occur, impermeable surfaces may also help immobilize vertical movement below the Site, resulting in lower groundwater concentrations over time. On-going groundwater monitoring by the property owners at 1345 and 1355 Fisher Road as well as the requested PSI 2 at 1360 Fisher Road will help to assess the effectiveness of current groundwater protection measures and the need for additional remedial actions relating to the source control at the Site. In 2021, nitrate concentrations in groundwater at:

- MW13-4 (Figure 10) have remained below the CSR and GCDWQ guideline limits.
 However, nitrate concentrations have steadily increased overtime from 0.3 to 4.2 mg/L
 (Table A7), exceeding background concentration (0.5 mg/L) for aquifers in the South
 Cowichan Valley (Barroso et.al, 2019). This suggest that other upgradient land users are
 contributing to nitrate loading in groundwater at the Site.
- MW12-3 (Figure 11) are above CSR and GCDWQ guideline limits and have fluctuated over time from 15.3 mg/L in 2012 to 18.9 mg/L in 2021, with the highest concentration of 27.5 mg/L reported in 2018 (Table A7). Source control measures have been implemented by the facility at 1345 Fisher Road as part of a Pollution Prevention Order issued by ENV

in 2018. These changes to leachate containment are expected to reduce/eliminate nitrate loading into the subsurface. The property owner of 1345 Fisher Road is required to monitor MW12-3 twice per year as part of their Licence under CVRD Bylaw No. 2570.

- 1355 Fisher Road MW19-5 exceeded the guideline limit for the first time in December 2020 (Figure 12) with a concentration of 16.9 mg/L. The recent increases could be the result of residual nitrates flushing through the soil column from increased groundwater recharge during the fall of 2020. However, trends are hard to distinguish due to limited data collection from this well (only four samples to date). It is expected that source control measures at 1355 Fisher Road are helping to reduce nitrate concentrations in the groundwater. This is evident by the continuous reduction in nitrate concentrations (from 28.0 to 10.4 mg/L) at MW12-1, which is downgradient of this facility (Figure 13).
- MW12-2 (Figure 14) and the 1355 Fisher Road Production Well (Figure 15), both downgradient of the former greenhouse property at 1360 Fisher Road, continued to exceed the CSR and GCDWQ standards. However, nitrate concentrations have generally reduced from 98.1 mg/L in 2012 to 37.3 mg/L in 2021 and from 81.1 mg/L in 2008 to 18.3 mg/L in 2021, respectively. Source containment from pumping at the 1355 Fisher Road Production Well is helping reduce the nitrate concentrations through enhancement of groundwater movement. The pumped groundwater is being used by the composting facility at 1355 Fisher Road to add moisture to the compost during the composting process. Excess moisture in the form of compost leachate is recaptured and recirculated in the composting process. Pumped groundwater is also used to control dust on paved and unpaved roads at the facility. The impact of using the contaminated groundwater for dust suppression was discussed in the Liquid Waste Management Plan as part of this facility's Operating Permit #108536. No added impact to the receiving environment is expected as pathways for nitrate leaching have been mitigated.

4.0 SUMMARY AND CONCLUSIONS

The Fisher Road Site is located near a watershed divide where surface drainage is predominantly directed south towards the Shawnigan Creek watershed and a small portion to the north, towards the Patrolas Creek watershed. The underlying groundwater system is characterized by a semi-confined aquifer (mapped Aquifer 206/197) that is currently in use for domestic and industrial water supply. Groundwater is recharged by precipitation travelling through the unsaturated zone. The groundwater flow direction in the aquifer is towards the northwest.

Historical agricultural, commercial, and industrial land use has caused nitrate contamination in groundwater, which is in contravention of the Groundwater and Drinking Water Protection Regulations under the Water Sustainability Act. Several groundwater studies and investigations have been completed by the CHAITG working group members to assess the nitrate levels in groundwater and the possible sources at the Site. This included the installation of four CVRD groundwater monitoring wells in 2012-2013, upgradient and downgradient of the suspected

contaminant sources, to quantify the issue at the time. In 2020 and 2021, Waterline was retained to review the information collected to date and completed annual groundwater sampling programs.

The following observations are provided:

- Three distinct nitrate sources in groundwater have been reconfirmed at the Site:
 - Organic nitrate from composing operations at the 1345 and 1355 Fisher Road properties,
 - Organic nitrate from agricultural (manure) and rural land use practices (septic) upgradient of the Site, and
 - o Inorganic nitrate from fertilizers used for growing vegetables at the former greenhouse operation at 1360 Fisher Road.
- Nitrates in groundwater from all three sources appear to be migrating in a northwest direction along the natural groundwater flow path. As such, Waterline encourages all private domestic groundwater user downgradient of the Site, to complete potability testing of their groundwater supply wells.
- Nitrate concentrations reported from MM13-4, located upgradient of the Site are not exceeding guideline concentrations but are above background concentrations estimated for Aquifer 196/206. Concentrations have steadily increased over the period of record, suggesting that upgradient land users are also contributing to nitrate loading in groundwater at the Site.
- The mass of nitrate retained in the soil column beneath 1345, 1355 and 1360 Fisher Road
 is unknown. Some flushing of the residual nitrates may occur over time to field capacity;
 however, impermeable surfaces may also help immobilize vertical movement below the
 Site. Nitrate concentrations in groundwater at the Site are reported to be above the
 applicable CSR and GCDWQ drinking water quality standards.
- While in operation, the composting facilities at 1345 and 1355 Fisher Road are required under provisions of the Environmental Management Act and CVRD Bylaw 2570 to collect groundwater samples for determination of general groundwater chemistry and nitrate concentrations. This ongoing performance monitoring by the facility owners will verify the effectiveness of the sources control measures at their composting facilities. It will have the added benefit of indicating if nitrate concentrations in groundwater at 1360 Fisher Road, from historical land use practices, are also reducing.
- The proposed re-zoning of 1360 Fisher Road may provide an opportunity to address the fertilizer contamination, to help delineate and reduce ongoing nitrate loading on the aguifer.
- Based on the current source control measures, decreases in nitrate concentrations at the Site to below guideline concentrations is expected to take some time.
- Waterline understand that while historical land use decisions were made with out an
 assessment of potential impacts on groundwater, new tools, such as those available under
 the Water Sustainability Act and the CVRD's Regional Drinking Water and Water Protection
 Program will enhanced protection of water resources going forward.

5.0 CERTIFICATION

This document was prepared under the direction of a professional hydrogeologist registered in the Province of British Columbia. Both the author and reviewer of the enclosed report are qualified groundwater professionals as defined under the Water Sustainability Act and associated Groundwater Protection Regulation.

Notes:

Guidelines - Health Canada, September 2020, Guidelines for Canadian Drinking Water Quality (GCDWQ), Summary Table.

Yellow highlight - Value exceeds the Maximum Acceptable Concentration (MAC).

Red highlight - Value exceeds the BC Reg. 196/2017

Guidelines - Health Canada, September 2020, Guidelines for Canadian Drinking Water Quality (GCDWQ), Summary Table.

Laboratory results that were less than detection limits and greater than the applied guidelines are not shown as exceedances.

Yellow highlight - Value exceeds the Maximum Acceptable Concentration (MAC).

Guidelines - Health Canada, September 2020, Guidelines for Canadian Drinking Water Quality (GCDWQ), Summary Table.

Yellow highlight - Value exceeds the Maximum Acceptable Concentration (MAC).

APPENDIX B

Photograph Log

Photograph B1 (LEFT): Looking north at MW12-1.

Photograph B2 (RIGHT): Looking down and northeast at MW12-2.

Photograph B4 (RIGHT): Looking down and west at MW13-4.

Photograph B5 (LEFT): Section of damaged PVC casing removed from MW12-3.

Photograph B6 (RIGHT): Looking down and south at MW12-3 after the well was repaired and the surface seal replaced.

APPENDIX C

Analytical Results (Laboratory Reports)

CERTIFICATE OF ANALYSIS

You know that the sample you collected after

snowshoeing to site, digging 5 meters, and

racing to get it on a plane so you can submit it

to the lab for time sensitive results needed to

make important and expensive decisions

(whew) is VERY important. We know that too.

PROJECT INFO Cowichan Valley RD COC NUMBER B84786

Introduction:

CARO Analytical Services is a testing laboratory full of smart, engaged scientists driven to make the world a safer and healthier place. Through our clients' projects we become an essential element for a better world. We employ methods conducted in accordance with recognized professional standards using accepted testing methodologies and quality control efforts. CARO is accredited by the Canadian Association for Laboratories Accreditation (CALA) to ISO 17025:2005 for specific tests listed in the scope of accreditation approved by CALA.

Big Picture Sidekicks

We've Got Chemistry

It's simple. We figure the more you enjoy working with our fun and engaged team members; the more likely you are to give us continued

opportunities to support you.

Ahead of the Curve

Through research, regulation knowledge, and instrumentation, we are your analytical centre for the technical knowledge you need, BEFORE you need it, so you can stay up to date and in the know.

If you have any questions or concerns, please contact me at tmaxwell@caro.ca

Miscellaneous Subcontracted Parameters

Refer to Appendix 0.00 - 2020-03-03

Sample Qualifiers:

FILT The sample has been filtered for DKN in the laboratory. Results may not reflect conditions at the time of sampling.

HT1 The sample was prepared and/or analyzed past the recommended holding time.

HT2 The 15 minute recommended holding time (from sampling to analysis) has been exceeded - field analysis is recommended.

PRES Sample has been preserved for DKN in the laboratory and the holding time has been extended.

WORK ORDER REPORTED 0030004

2020-04-22 17:35

General Comments:

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. This analytical report must be reproduced in its entirety. CARO is not responsible for any loss or damage resulting directly or indirectly from error or omission in the conduct of testing. Liability is limited to the cost of analysis. Samples will be disposed of 30 days after the test report has been issued unless otherwise agreed to in writing.

Results in **Bold** indicate values that are above CARO's method reporting limits. Any results that are above regulatory limits are highlighted **red**. Please note that results will only be highlighted red if the regulatory limits are included on the CARO report. Any Bold and/or highlighted results do <u>not</u> take into account method uncertainty. If you would like method uncertainty or regulatory limits to be included on your report, please contact your Account Manager:tmaxwell@caro.ca

APPENDIX 2: QUALITY CONTROL RESULTS

REPORTED TO Waterline Resources Inc. - Nanaimo

PROJECT 3241-20-001

WORK ORDER REPORTED 0030004 2020-04-22 17:35

112. 01.125

The following section displays the quality control (QC) data that is associated with your sample data. Groups of samples are prepared in "batches" and analyzed in conjunction with QC samples that ensure your data is of the highest quality. Common QC types include:

- **Method Blank (Blk)**: A blank sample that undergoes sample processing identical to that carried out for the test samples. Method blank results are used to assess contamination from the laboratory environment and reagents.
- Duplicate (Dup): An additional or second portion of a randomly selected sample in the analytical run carried through the entire
 analytical process. Duplicates provide a measure of the analytical method's precision (reproducibility).
- Blank Spike (BS): A sample of known concentration which undergoes processing identical to that carried out for test samples,
 also referred to as a laboratory control sample (LCS). Blank spikes provide a measure of the analytical method's accuracy.
- Matrix Spike (MS): A second aliquot of sample is fortified with with a known concentration of target analytes and carried through the entire analytical process. Matrix spikes evaluate potential matrix effects that may affect the analyte recovery.
- Reference Material (SRM): A homogenous material of similar matrix to the samples, certified for the parameter(s) listed.
 Reference Materials ensure that the analytical process is adequate to achieve acceptable recoveries of the parameter(s) tested.

Each QC type is analyzed at a 5-10% frequency, i.e. one blank/duplicate/spike for every 10-20 samples. For all types of QC, the specified recovery (% Rec) and relative percent difference (RPD) limits are derived from long-term method performance averages and/or prescribed by the reference method.

CERTIFICATE OF ANALYSIS

You know that the sample you collected after

snowshoeing to site, digging 5 meters, and

racing to get it on a plane so you can submit it

to the lab for time sensitive results needed to

make important and expensive decisions

(whew) is VERY important. We know that too.

Introduction:

CARO Analytical Services is a testing laboratory full of smart, engaged scientists driven to make the world a safer and healthier place. Through our clients' projects we become an essential element for a better world. We employ methods conducted in accordance with recognized professional standards using accepted testing methodologies and quality control efforts. CARO is accredited by the Canadian Association for Laboratories Accreditation (CALA) to ISO/IEC 17025:2017 for specific tests listed in the scope of accreditation approved by CALA.

Big Picture Sidekicks

We've Got Chemistry

It's simple. We figure the more you enjoy with fun and working our engaged team the more members; likely you are to give us continued opportunities to support you.

Ahead of the Curve

regulation Through research, knowledge, and instrumentation, are your analytical centre the technical knowledge you BEFORE you need it, so you can stay up to date and in the know.

If you have any questions or concerns, please contact me at tmaxwell@caro.ca

General Comments:

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. This analytical report must be reproduced in its entirety. CARO is not responsible for any loss or damage resulting directly or indirectly from error or omission in the conduct of testing. Liability is limited to the cost of analysis. Samples will be disposed of 30 days after the test report has been issued or once samples expire, whichever comes first. Longer hold is possible if agreed to in writing.

Results in **Bold** indicate values that are above CARO's method reporting limits. Any results that are above regulatory limits are highlighted **red**. Please note that results will only be highlighted red if the regulatory limits are included on the CARO report. Any Bold and/or highlighted results do <u>not</u> take into account method uncertainty. If you would like method uncertainty or regulatory limits to be included on your report, please contact your Account Manager:tmaxwell@caro.ca

Please note any regulatory guidelines applied to this report are added as a convenience to the client, at their request, to help provide some initial context to analytical results obtained. Although CARO makes every effort to ensure accuracy of the associated regulatory guideline(s) applied, the guidelines applied cannot be assumed to be correct due to a variety of factors and as such CARO Analytical Services assumes no liability or responsibility for the use of those guidelines to make any decisions. The original source of the regulation should be verified and a review of the guideline (s) should be validated as correct in order to make any decisions arising from the comparison of the analytical data obtained to the relevant regulatory guideline for one's particular circumstances. Further, CARO Analytical Services assumes no liability or responsibility for any loss attributed from the use of these guidelines in any way.

PROJECT 3241-20-001

WORK ORDER REPORTED

21C0880 2021-03-17 16:50

The following section displays the quality control (QC) data that is associated with your sample data. Groups of samples are prepared in "batches" and analyzed in conjunction with QC samples that ensure your data is of the highest quality. Common QC types include:

- Method Blank (Blk): A blank sample that undergoes sample processing identical to that carried out for the test samples. Method blank results are used to assess contamination from the laboratory environment and reagents.
- Duplicate (Dup): An additional or second portion of a randomly selected sample in the analytical run carried through the entire
 analytical process. Duplicates provide a measure of the analytical method's precision (reproducibility).
- Blank Spike (BS): A sample of known concentration which undergoes processing identical to that carried out for test samples,
 also referred to as a laboratory control sample (LCS). Blank spikes provide a measure of the analytical method's accuracy.
- Matrix Spike (MS): A second aliquot of sample is fortified with with a known concentration of target analytes and carried through
 the entire analytical process. Matrix spikes evaluate potential matrix effects that may affect the analyte recovery.
- Reference Material (SRM): A homogenous material of similar matrix to the samples, certified for the parameter(s) listed.
 Reference Materials ensure that the analytical process is adequate to achieve acceptable recoveries of the parameter(s) tested.

Each QC type is analyzed at a 5-10% frequency, i.e. one blank/duplicate/spike for every 10-20 samples. For all types of QC, the specified recovery (% Rec) and relative percent difference (RPD) limits are derived from long-term method performance averages and/or prescribed by the reference method.
